## 2 Introduction

We want to enforce key protection, transaction confidentiality and transaction integrity against potential malware on the Host. To achieve that we propose to use a Ledger Nano S/X as a 2nd factor trusted device. Such a device has small amount of memory and is not capable of holding the entire transaction or building the required proofs in RAM. So we need to split the process between the host and the NanoS. This draft note explain how.

To summarize, the signature process is:

- . Generate a TX key pair  $(r, R)$
- . Process Stealth Payment ID
- . For each input  $T_{in}$  to spend:
  - Compute the input public derivation data  $\mathfrak{D}_{in}$
  - Compute the spend key  $(x_{in}, P_{in})$  from  $R_{in}$  and  $b$
  - Compute the key image  $I_{in}$  of  $x_{in}$
- . For each output  $T_{out}$  :
  - Compute the output secret derivation data  $\mathfrak{D}_{out}$
  - Compute the output public key  $P_{out}$
- . For each output  $T_{out}$  :
  - compute the range proof
  - blind the amount
- . Compute the final confidential ring signature
- . Return TX

### 3 Notation

Elliptic curve points, such as pubic keys, are written in italic upper case, and scalars, such as private keys, are written in italic lower case:

- $spk$  : protection key
- $(r, R)$  : transaction key pair
- $(a, A) (b, B)$  : sender main view/spend key pair
- $(c, C) (d, D)$  : sender sub view/spend key pair
- $A_{out} B_{out}$  : receiver main view/spend public keys
- $C_{out} D_{out}$  : receiver sub view/spend public key
- $h$  : 2nd group generator, such  $H = h.G$  and  $h$  is unknown
- amount : amount to send/spend
- mask : secret amount mask factor
- $C_v$  : commitment to a with v such  $C_v = k.G + v.H$
- $\alpha_{in}$  : secret co-signing key for ith input
- $x_{in}$  : secret signing key for ith input
- $P_{in}$  : public key of ith input
- $P_{out}$  : public key of ith output
- $\mathfrak{D}_{out} \mathfrak{D}_{in}$  : first level derivation data

Hash and encryption function:

- $AES : [k](m)$  AES encryption of  $m$  with key  $k$
- $AES^{-1} : [k](c)$  AES decryption of  $c$  with key  $k$

Others:

- $PayID$  : Stealth payment ID
- $ENC\_PAYMENT\_ID\_TAIL$  : 0x82

## 4 State Machine

TBD

## 5 Commands overview

### 5.1 Introduction

Hereafter are the code integration and application specification.

The commands are divided in three sets:

- Provisioning
- Low level crypto command
- High level transaction command

The low level set is a direct mapping of some crypto Monero function. For such command the Monero function will be referenced.

The high level set encompasses functions that handle the confidential/sensitive part of full transaction

### 5.2 Common command format

All command follow the generic ISO7816 command format, with the following meaning:

byte	length	description
CLA	01	Protocol version
INS	01	Command
P1	01	Sub command
P2	01	Command/Sub command counter
LC	01	byte length of data
data	01	options
	var	additional data

When a command/sub-command can be sent repeatedly, the counter must be increased by one at each command. The flag **last sub command indicator** must be set to indicate another command will be sent.

*Common option encoding*

x-----	Last sub command indicator
1-----	More identical subcommand forthcoming
0-----	Last sub command

## 6 Provisioning And Key Management

### 6.1 Overview

There is no provisioning in a standard setup. Both key pairs  $(a, A)$  and  $(b, B)$  should be derived under BIP44 path.

The general BIP44 path is :

`/ purpose' / coin_type' / account' / change / address_index`

and is defined as follow for any Monero main address:

`/44'/128'/account'/0/0`

so in hexa:

`/0x8000002C/0x80000080/0x8...../0x00000000/0x00000000`

The *address\_index* is set to 0 for the main address and will be used as sub-address index according to kenshi84 fork.

In case an already existing key needs to be transferred, an optional dedicated command may be provided. As there is no secure messaging for now, this transfer shall be done from a trusted Host. Moreover, as provisioning is not handled by Monero client, a separate tool must be provided.

### 6.2 Commands

#### 6.2.1 Reset

##### Description

Restart the application and check client/application versions compatibility.

##### Command

CLA	INS	P1	P2	LC
02	02	00	00	11

##### Command data

Length	Value
01	00
var	string version, without trailing null byte

##### Response data

Length	Value
01	Application major version
01	Application minor version
01	Application micro version

### 6.2.2 Put keys

#### Description

Put sender key pairs.

This command allows to set specific key on the device and should only be used for testing purpose.

The application shall:

check  $A == a.G$   
check  $B == b.G$   
store  $a, A, b, B$

#### Command

CLA	INS	P1	P2	LC
02	22	00	00	e0

#### Command data

Length	Value
01	00
20	$a$
20	$A$
20	$b$
20	$B$
5f	Base58 encoded public key

#### Response data

Length	Value

### 6.2.3 Get Public Key

#### Description

Retrieves public base58 encoded public key.

#### Command

CLA	INS	P1	P2	LC
02	20	01	00	01

#### Command data

Length	Value
01	00

#### Response data

Length	Value
20	"A" view public key
20	"B" view spend key
5f	Base58 encoded public key

### 6.2.4 Get Private View Keys

#### Description

Retrieves the private view key in order to accelerate the blockchain scan.

The device should ask the user to accept or reject this export. If rejected the client will use the device for scanning the blockchain.

#### Command

CLA	INS	P1	P2	LC
02	20	02	00	01

#### Command data

Length	Value
01	00

#### Response data

Length	Value
20	"a" secret view key

### 6.2.5 Display Address

#### Monero

#### Description

Display requested main address ,sub address or integrated address.

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$

if payment ID is provided:

compute  $xP = x.G$

check  $xP == P$

#### Command

CLA	INS	P1	P2	LC
02	21	xx	00	11

if P1 is '00' display non-integrated address.

if P1 is '01' display integrated address.

Any other value will be rejected.

#### Command data

Length	Value
01	00
08	index (Major.minor) <i>index</i>
08	Payment ID, (or '0000000000000000')

#### Response data

Length	Value
--------	-------

## 7 Low level crypto commands

### 7.1 Overview

This section describe lowlevel commands that can be used in a transaction or not.

### 7.2 Commands

#### 7.2.1 Verify Keys

##### Monero

device\_default::verify\_keys.

##### Description

Verify that the provided private key and public key match.

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$   
compute  $xP = x.G$   
check  $xP == P$

##### Command

CLA	INS	P1	P2	LC
02	26	xx	00	41

if P1 is '00' the provided public key will be used.

if P1 is '01' the public view is key will be used and the provided public key will be 'ignored'

if P is '02' the public spend is key will be used and the provided public key will be 'ignored'

Any other value will be rejected.

##### Command data

Length	Value
01	00
20	secret key $\tilde{x}$
20	public key or '00'*32 $P$

##### Response data

Length	Value

### 7.2.2 Get ChaCha8 PreKey

Monero

#### Description

compute  $s = h(A \parallel B \parallel \text{ENC\_PAYMENT\_ID\_TAIL})$

return the full internal state (200 bytes) of Keccak.

#### Command

CLA	INS	P1	P2	LC
02	24	00	00	00

#### Command data

Length	Value

#### Response data

Length	Value
C8	ChaCha8 prekey

### 7.2.3 Generate Key Derivation

Monero

crypto::generate\_key\_derivation.

#### Description

Compute the secret key derivation and returned it encrypted.

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$   
compute  $\mathfrak{D}_{\text{in}} = \text{KeyDerivation}(x, P)$   
compute  $\widetilde{\mathfrak{D}_{\text{in}}} = \text{AES}[\text{spk}](\mathfrak{D}_{\text{in}})$

return  $\widetilde{\mathfrak{D}_{\text{in}}}$ .

#### Command

CLA	INS	P1	P2	LC
02	32	00	00	41 or 61

#### Command data

Length	Value
01	00
20	public key $P$
20	secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)

#### Response data

Length	Value
20	encrypted key derivation $\widetilde{\mathfrak{D}}_{\text{in}}$
20	ephemeral hmac (optional, only during active transaction)

### 7.2.4 Derivation To Scalar

#### Monero

crypto::derivation\_to\_scalar.

#### Description

Transform a secret derivation data to a secret scalar according to its index.

compute  $\mathfrak{D}_{\text{in}} = \text{AES}^{-1}[\text{spk}](\widetilde{\mathfrak{D}}_{\text{in}})$   
compute  $s = \text{HashPointToScalar}(\mathfrak{D}_{\text{in}}, \text{index})$   
compute  $\tilde{s} = \text{AES}[\text{spk}](s)$

return  $\tilde{s}$ .

#### Command

CLA	INS	P1	P2	LC
02	34	00	00	25 or 45

#### Command data

Length	Value
01	00
20	encrypted key derivation $\widetilde{\mathfrak{D}}_{\text{in}}$

Length	Value
20	ephemeral hmac (optional, only during active transaction)
04	index

### Response data

Length	Value
20	encrypted scalar $\widetilde{s}$
20	ephemeral hmac (optional, only during active transaction)

## 7.2.5 Derive Public Key

### Monero

crypto::derive\_public\_key.

### Description

Compute a new public key from some secret derivation data, a parent public key and its index.

compute  $\widetilde{\mathfrak{D}}_{\text{in}} = \text{AES}^{-1}[\text{spk}](\widetilde{\mathfrak{D}}_{\text{in}})$

derivation\_to\_scalar:

compute  $s = \text{HashPointToScalar}(\mathfrak{D}_{\text{in}}, \text{index})$

then:

compute  $P' = P + s \cdot G$

return  $P'$ .

### Command

CLA	INS	P1	P2	LC
02	36	00	00	25 or 45

### Command data

Length	Value
01	00
20	encrypted key derivation $\widetilde{\mathfrak{D}}_{\text{in}}$
20	ephemeral hmac (optional, only during active transaction)
04	index
20	public key $P$

## Response data

Length	Value
20	public key $P'$

### 7.2.6 Derive Secret Key

#### Monero

crypto::derive\_secret\_key.

#### Description

Compute a new secret key from some secret derivation data, a parent secret key and its index.

compute  $\widetilde{\mathfrak{D}}_{\text{in}} = \text{AES}^{-1}[\text{spk}](\widetilde{\mathfrak{D}}_{\text{in}})$   
compute  $x = \text{AES}^{-1}[\text{spk}](\widetilde{x})$

derivation\_to\_scalar:

compute  $s = \text{HashPointToScalar}(\mathfrak{D}_{\text{in}}, \text{index})$

then:

compute  $x' = (x+s) \% \#n$   
compute  $\widetilde{x}' = \text{AES}[\text{spk}](x)$

return  $\widetilde{x}$ .

#### Command

CLA	INS	P1	P2	LC
02	38	00	00	65 or 85

## Command data

Length	Value
01	00
20	encrypted key derivation $\widetilde{\mathfrak{D}}_{\text{in}}$
20	ephemeral hmac (optional, only during active transaction)
04	index
20	encrypted secret key $\widetilde{x}$
20	ephemeral hmac (optional, only during active transaction)

## Response data

Length	Value
20	encrypted derived secret key $\widetilde{x}$
20	ephemeral hmac (optional, only during active transaction)

### 7.2.7 Derive Subaddress Public Key

#### Monero

crypto\_ops::derive\_subaddress\_public\_key.

#### Description

compute  $\widetilde{\mathfrak{D}}_{\text{in}} = \text{AES}^{-1}[\text{spk}](\widetilde{\mathfrak{D}}_{\text{in}})$   
compute  $s = \text{HashPointToScalar}(\mathfrak{D}_{\text{in}}, \text{index})$   
compute  $P' = P - s.G$

return  $P'$

#### Command

CLA	INS	P1	P2	LC
02	46	00	00	45 or 65

#### Command data

Length	Value
01	00
20	public key $P$
20	encrypted derivation key $\widetilde{\mathfrak{D}}_{\text{in}}$
20	ephemeral hmac (optional, only during active transaction)
04	index $\text{index}$

#### Response data

Length	Value
20	sub public key $P'$

### 7.2.8 Get Subaddress Spend Public Key

#### Monero

device\_default::get\_subaddress\_spend\_public\_key.

#### Description

```

get_subaddress_secret_key:
    compute  $s = h(\text{"SubAddr"} \parallel A \parallel index)$ 
    compute  $x = s \% \#n$ 

```

then:

```

    compute  $d = B + x.G$ 

```

return  $d$

#### Command

CLA	INS	P1	P2	LC
02	4a	00	00	09

#### Command data

Length	Value
01	00
08	index (Major.minor) <i>index</i>

#### Response data

Length	Value
20	sub spend public key $d$

### 7.2.9 Get Subaddress Secret Key

#### Monero

```

get_subaddress_secret_key

```

#### Description

```

    compute  $x = \text{AES}^{-1}[spk](\tilde{x})$ 
    compute  $s = h(\text{"SubAddr"} \parallel x \parallel index)$ 
    compute  $d = s \% \#n$ 
    compute  $\tilde{d}_i = \text{AES}^{-1}[spk](d)$ 

```

return  $\tilde{d}_i$

#### Command

CLA	INS	P1	P2	LC
02	4c	00	00	39 or 59

#### Command data

Length	Value
01	00
20	secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)
08	index (Major.minor) <i>index</i>

#### Response data

Length	Value
20	sub secret key $\tilde{d}_i$
20	ephemeral hmac (optional, only during active transaction)

#### 7.2.10 Get Subaddress

##### Monero

device\_default::get\_subaddress\_secret\_key.

##### Description

compute  $s = h(\text{"SubAddr"} \parallel A \parallel \text{index})$   
 compute  $x = s \% \#n$

then:

compute  $d = B + x.G$   
 compute  $c = A.d$

return  $c, d$

##### Command

CLA	INS	P1	P2	LC
02	48	00	00	09

#### Command data

Length	Value
01	00

Length	Value
08	index (Major.minor) <i>index</i>

### Response data

Length	Value
20	sub view public key <i>c</i>
20	sub spend public key <i>d</i>

### 7.2.11 Generate Key Image

#### Monero

crypto::generate\_key\_image.

#### Description

Compute the key image of a key pair.

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$   
compute  $P' = \text{HashToPoint}(P)$   
compute  $\text{Img}(P) = x.P'$

return  $\text{Img}(P)$ .

#### Command

CLA	INS	P1	P2	LC
02	3a	00	00	41 or 61

#### Command data

Length	Value
01	00
20	public key <i>P</i>
20	secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)

### Response data

Length	Value
20	key image $\text{Img}(P)$

### 7.2.12 Generate Keypair

#### Monero

crypto::generate\_keys.

#### Description

Generate a new keypair and return it. The secret key is returned encrypted.

```
generate  $x$ 
compute  $xP = x.P$ 
compute  $\tilde{x} = \text{AES}[spk](x)$ 
```

return  $P, \tilde{x}$ .

#### Command

CLA	INS	P1	P2	LC
02	40	00	00	01

#### Command data

Length	Value
01	00

#### Response data

Length	Value
20	public key $P$
20	encrypted secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)

### 7.2.13 Secret Key To Public Key

#### Monero

crypto::secret\_key\_to\_public\_key.

#### Description

Compute a public key from secret a secret key.

```
compute  $x = \text{AES}^{-1}[spk](\tilde{x})$ 
compute  $P = x.G$ 
```

return  $P$ .

**Command**

CLA	INS	P1	P2	LC
02	30	00	00	21 or 41

**Command data**

Length	Value
01	00
20	encrypted secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)

**Response data**

Length	Value
20	public key $P$

**7.2.14 Secret Add****Monero**

sc\_add

**Description**

compute  $x_1 = \text{AES}^{-1}[\text{spk}](\widetilde{x_1})$   
 compute  $x_2 = \text{AES}^{-1}[\text{spk}](\widetilde{x_2})$   
 compute  $x = x_1 + x_2$   
 compute  $\tilde{x} = \text{AES}[\text{spk}](x)$

return  $\tilde{x}$ .**Command**

CLA	INS	P1	P2	LC
02	3c	00	00	41 or 61

**Command data**

Length	Value
01	00
20	secret key $\widetilde{x_1}$
20	ephemeral hmac (optional, only during active transaction)

Length	Value
20	secret key $\widetilde{x}_2$
20	ephemeral hmac (optional, only during active transaction)

#### Response data

Length	Value
20	secret key $\widetilde{x}$
20	ephemeral hmac (optional, only during active transaction)

#### 7.2.15 Secret Sub

##### Monero

sc\_sub

##### Description

compute  $x_1 = \text{AES}^{-1}[\text{spk}](\widetilde{x}_1)$   
compute  $x_1 = \text{AES}^{-1}[\text{spk}](\widetilde{x}_1)$   
compute  $x = x_1 - x_2$   
compute  $\widetilde{x} = \text{AES}[\text{spk}](x)$

return  $\widetilde{x}$ .

##### Command

CLA	INS	P1	P2	LC
02	3E	00	00	41 or 61

##### Command data

Length	Value
01	00
20	secret key $\widetilde{x}_1$
20	ephemeral hmac (optional, only during active transaction)
20	secret key $\widetilde{x}_2$
20	ephemeral hmac (optional, only during active transaction)

##### Response data

Length	Value
20	secret key $\widetilde{x}$

Length	Value
20	ephemeral hmac (optional, only during active transaction)

### 7.2.16 Secret Scalar Mult Key

#### Monero

ret::scalarmultKey.

#### Description

Multiply a secret scalar with a public key.

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$   
compute  $xP = x.P$

return  $xP$

#### Command

CLA	INS	P1	P2	LC
02	42	00	00	41 or 61

#### Command data

Length	Value
01	00
20	public key $P$
20	secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)

#### Response data

Length	Value
20	new public key $xP$

### 7.2.17 Secret Scalar Mult Base

#### Monero

ret::scalarmultBase.

#### Description

Multiply a secret scalar with the publis base point  $G$ .

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$   
 compute  $xG = x.G$

return  $xG$

#### Command

CLA	INS	P1	P2	LC
02	44	00	00	21 or 41

#### Command data

Length	Value
01	00
20	secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)

#### Response data

Length	Value
00	
20	new public key $xG$

### 7.2.18 Stealth

#### Monero

#### Description

Encrypt payment ID

compute  $x = \text{AES}^{-1}[\text{spk}](\tilde{x})$   
 compute  $\mathfrak{D}_{\text{in}} = \text{KeyDerivation}(P, x)$   
 compute  $s = \text{HashToScalar}(\mathfrak{D}_{\text{in}} \parallel \text{ENC\_PAYMENT\_ID\_TAIL})$   
 compute  $\text{PayID} = \widehat{\text{PayID}}^s$

return  $\text{PayID}$

#### Command

CLA	INS	P1	P2	LC
02	44	00	00	61 or 81

#### Command data

Length	Value
01	00
20	public key $P$
20	encrypted secret key $\tilde{x}$
20	ephemeral hmac (optional, only during active transaction)
20	encrypted payment ID $\widetilde{PayID}$

### Response data

Length	Value
20	payment ID $PayID$

### 7.2.19 Unblind

#### Monero

#### Description

Unblind amount and his mask.

First:

compute  $\mathcal{AK}_{\text{amount}} = \text{AES}^{-1}[spk](\widetilde{\mathcal{AK}_{\text{amount}}})$

If blind V1:

compute  $s = \text{HashToScalar}(\mathcal{AK}_{\text{amount}})$

compute  $\widetilde{\text{mask}} = \text{mask} - s$

compute  $s = \text{HashToScalar}(A)$

compute  $\text{amount} = \text{amount} - s$

**If blind V2:** compute  $\text{mask} =$

compute  $s = \text{HashToScalar}(\text{"commitment\_mask"} \mid \mathcal{AK}_{\text{amount}}) \% \text{order}$

compute  $s = \text{HashToScalar}(\text{"amount"} \mid \mathcal{AK}_{\text{amount}})$

compute  $\text{amount}[0:7] = \widetilde{\text{amount}}[0:7] \wedge s[0:7]$

return  $\widetilde{\text{mask}}, \widetilde{\text{amount}}$

#### Command

CLA	INS	P1	P2	LC
02	44	00	00	61 or 81

*specific options*

-----xx	Commitment scheme version
-----10	Blind V2
-----00	Blind V1

### Command data

Length	Value
01	xx
20	encrypted blinding factor $\mathcal{AK}_{\text{amount}}$
20	ephemeral hmac (optional, only during active transaction)
20	blinded mask $\widetilde{\text{mask}}$
20	blinded amount $\widetilde{\text{amount}}$

### Response data

Length	Value
20	mask $\widetilde{\text{mask}}$
20	amount $\widetilde{\text{amount}}$

## 8 High Level Transaction command

### 8.1 Transaction process overview

The transaction is mainly generated in `construct_tx_and_get_tx_key` (or `construct_tx`) and `construct_tx_with_tx_key` functions.

First, a new transaction keypair  $(r, R)$  is generated.

Then, the stealth payment id is processed if any.

Then, for each input transaction to spend, the input key image is retrieved.

Then, for each output transaction, the ephemeral destination key and the blinding key amount  $\mathcal{AK}_{\text{amount}}$  are computed.

Once  $T_{in}$  and  $T_{out}$  keys are set up, the `genRCT/genRctSimple` function is called.

First a commitment  $C_v$  to each amount amount and its associated range proof are computed to ensure the amount amount confidentiality. The commitment and its range proof do not imply any secret and generate  $C_v$ , mask such  $C_v = k.G + v.H$ .

Then mask and amount are blinded by using the  $\mathcal{AK}_{\text{amount}}$  which is only known in an encrypted form by the host.

After all commitments have been setup, the confidential ring signature happens. This signature is performed by calling `proveRctMG` which then calls `MLSAG_Gen`.

At this point the amounts and destination keys must be validated on the NanoS. This information is embedded in the message to sign by calling `get_pre_mlsag_hash`, prior to calling `ProveRctMG`. So the `get_pre_mlsag_hash` function will have to be modified to serialize the rv transaction to NanoS which will validate the tuple  $\langle \text{amount}, \text{dest} \rangle$  and compute the prehash. The prehash will be kept inside NanoS to ensure its integrity. Any further access to the prehash will be delegated.

Once the prehash is computed, the `proveRctMG` is called. This function only builds some matrix and vectors to prepare the signature which is performed by the final call `MLSAG_Gen`.

During this last step some ephemeral key pairs are generated :  $\alpha_{in}, \alpha_{in}.G$ . All  $\alpha_{in}$  must be kept secret to protect the  $x_{in}$  keys. Moreover we must avoid signing arbitrary values during the final loop.

In order to achieve this validation, we need to approve the original destination address  $A_{out}B_{out}$ , which is not recoverable from P out . Here the only solution is to pass the original destination with the mask, amount,  $\mathcal{AK}_{\text{amount}}$ .

Unblind mask and amount and then verify the commitment  $C_v = k.G + v.H$ . If  $C_v$  is verified and user validate  $A_{out}, B_{out}$  and amount, continue.

## 8.2 Transaction Commands

### 8.2.1 Open TX

#### Description

Open a new transaction. Once open the device impose a certain order in subsequent commands:

- OpenTX
- Stealth
- Get TX output keys
- Blind \*
- Initialize MLSAG-prehash
- Update MLSAG-prehash \*
- Finalize MLSAG-prehash
- MLSAG prepare
- MLSAG hash \*
- MLSAG sign
- CloseTX

During this sequence low level API remains available, but no other transaction can be started until the current one is finished or aborted.

Initialize  $\mathcal{H}_{\text{outkeys}}$   
 compute initial transaction key pair  $(r, R)$   
 return  $(r, R)$

#### Command

CLA	INS	P1	P2	LC
02	70	01	cnt	05

#### Command data

Length	Value
01	options
04	account identifier (ignored, RFU)

#### Response data

Length	Value
20	public transaction key $R$
20	encrypted private transaction key $\tilde{r}$
20	ephemeral hmac
20	ephemeral hmac of view key
20	ephemeral hmac of spend key

### 8.2.2 Set Signature Mode

#### Description

Set the signature to 'fake' or 'real'. In fake mode a random key is used to signed the transaction and no user confirmation is requested.

#### Command

CLA	INS	P1	P2	LC
02	72	00	00	02

#### Command data

Length	Value
01	options
01	'1' aka 'fake' or '2' aka real'

### Response data

Length	Value

### 8.2.3 Generate Commitment Mask

#### Description

compute  $s = \text{HashToScalar}(\text{"amount"} \parallel \mathcal{AK}_{\text{amount}})$

Return  $s$

#### Command

CLA	INS	P1	P2	LC
02	77	00	00	21

#### Command data

Length	Value
01	00
20	encrypted blinding factor $\mathcal{AK}_{\text{amount}}$
20	ephemeral hmac

### Response data

Length	Value
20	commitment mask $s$

### 8.2.4 Blind

#### Monero

#### Description

Blind amount and his mask.

First:

compute  $\mathcal{AK}_{\text{amount}} = \text{AES}^{-1}[\text{spk}](\widetilde{\mathcal{AK}_{\text{amount}}})$

If blind V1:

compute  $s = \text{HashToScalar}(\mathcal{AK}_{\text{amount}})$

```

compute  $\widetilde{\text{mask}}$  = mask + s
compute  $s = \text{HashToScalar}(A)$ 
compute  $\widetilde{\text{amount}}$  = amount + s

```

If blind V2:

```

set  $\widetilde{\text{mask}}$  to 32 zero bytes
compute  $s = \text{HashToScalar}(\text{"amount"} \parallel \mathcal{AK}_{\text{amount}})$ 
compute  $\widetilde{\text{amount}} = \text{amount}[0:7] \oplus s[0:7]$ 

```

return  $\widetilde{\text{mask}}, \widetilde{\text{amount}}$

#### Command

CLA	INS	P1	P2	LC
02	78	00	00	81

*specific options*

-----xx	Commitment scheme version
-----10	Blind V2
-----00	Blind V1

#### Command data

Length	Value
01	xx
20	encrypted blinding factor $\mathcal{AK}_{\text{amount}}$
20	ephemeral hmac
20	mask mask
20	amount amount

#### Response data

Length	Value
20	blinded mask $\widetilde{\text{mask}}$
20	blinded amount $\widetilde{\text{amount}}$

### 8.2.5 Generate TX output keys

#### Description

Compute additional key  $P$  if needed, amount key blinding and ephemeral destination key.

```

if need_additional_key :
  if is_subaddress :
    compute  $R' = \text{additional\_key}.B_{out}$ 
  else
    compute  $R' = \text{additional\_key}.G$ 

if is_change_address :
  compute  $\mathfrak{D}_{in} = \text{KeyDerivation}(A, R)$ 
else
  if need_additional_key and is_subaddress:
    compute  $\mathfrak{D}_{in} = \text{KeyDerivation}(\text{additional\_key}, A_{out})$ 
  else:
    compute  $\mathfrak{D}_{in} = \text{KeyDerivation}(R, A_{out})$ 

compute  $\mathcal{AK}_{amount} = \text{HashPointToScalar}(\mathfrak{D}_{in}, index)$ 
compute  $\widetilde{\mathcal{AK}}_{amount} = \text{AES}[spk](\mathcal{AK}_{amount})$ 

compute  $s = \text{HashPointToScalar}(\mathfrak{D}_{in}, index)$ 
compute  $P = B_{out} + s.G$ 

update  $\mathcal{H}_{outkeys} : \text{H}_{update}(A_{out}, B_{out}, is\_change, \mathcal{AK}_{amount})$ 
if option 'last' is set:
  finalize  $\mathcal{H}_{outkeys}$ 

```

The application returns

#### Command

CLA	INS	P1	P2	LC
02	7B	01	cnt	EC

#### Command data

Length	Value
01	options
04	tx version
20	secret tx key $R$
20	ephemeral hmac
20	public tx key $R$
20	destination public view key $A_{out}$
20	destination public spend key $B_{out}$
04	output index $index$

Length	Value
01	is change address
01	is subaddress
01	need additional key <i>need_additional_key</i> : 1 if yes, 0 else
20	encrypted additional key <i>additional_key</i> , if <i>need_additional_key</i> == 1, 0*32 else
20	ephemeral hmac

### Response data

Length	Value
20	encrypted amouny key blinding $\widetilde{\mathcal{AK}_{\text{amount}}}$
20	ephemeral hmac
20	ephemeral destination key $P$
20	additional Key $R'$ if <i>need_additional_key</i> == 1, not present else

## 8.2.6 Validate and Pre Hash

### 8.2.6.1 Initialize MLSAG-prehash

#### Description

During the first step, the application updates the  $\mathcal{H}$  with the transaction header:

if cnt == 1

```

    Finalize  $\mathcal{H}_{\text{outkeys}}$ 
    Initialize  $\mathcal{H}_{\text{outkeys}}$ 
    Initialize  $\mathcal{H}_{\text{commitment}}$ 
    Initialize  $\mathcal{H}$ 
    update  $\mathcal{H} : \mathcal{H}_{\text{update}}(\text{txnFee})$ 
    request user to validate txnFee

```

else

```

    update  $\mathcal{H} : \mathcal{H}_{\text{update}}(\text{pseudoOut})$ 

```

#### Command

CLA	INS	P1	P2	LC
02	7C	01	cnt	var

#### Command data

if cnt==1 :

Length	Value
01	options
01	type
varint	txnFee

if cnt>1 :

Length	Value
20	pseudoOut

### 8.2.6.2 Update MLSAG-prehash

#### Description

On the second step the application receives amount and destination and check values. It also re-compute the  $\mathcal{H}_{\text{outkeys}}$  value to ensure consistency with steps 3 and 4. So for each command received, do:

```

compute  $\mathcal{AK}_{\text{amount}} = \text{AES}^{-1}[\text{spk}](\widetilde{\mathcal{AK}_{\text{amount}}})$ 

update  $\mathcal{H}_{\text{outkeys}}$  :  $\text{H}_{\text{update}}(A_{\text{out}} \mid B_{\text{out}} \mid \text{is\_change} \mid \mathcal{AK}_{\text{amount}})$ 

if blind v1
  compute mask =  $\widetilde{\text{mask}} - \text{HashToScalar}(\mathcal{AK}_{\text{amount}})$ 
  compute amount =  $\widetilde{\text{amount}} - \text{HashToScalar}(\text{HashToScalar}(\mathcal{AK}_{\text{amount}}))$ 

if blind v2
  compute mask =  $\text{HashToScalar}(\text{"commitment\_mask"} \mid \mathcal{AK}_{\text{amount}})$ 
% #n
  compute  $s = \text{HashToScalar}(\text{"amount"} \mid \mathcal{AK}_{\text{amount}})$ 
  compute amount[0:7] =  $\widetilde{\text{amount}}[0:7] \wedge s[0:7]$ 

check  $C_v == \text{mask}.G + \text{amount}.h \mid$ 
update  $\mathcal{H}_{\text{commitment}}$  :  $\text{H}_{\text{update}}(C_v)$ 

if last command:
  finalize  $\mathcal{H}_{\text{outkeys}}$ 
  check  $\mathcal{H}_{\text{outkeys}}' == \mathcal{H}_{\text{outkeys}}$ 
  finalize  $\mathcal{H}_{\text{commitment}}$ 

update  $\mathcal{H}$  :  $\text{H}_{\text{update}}(\text{ecdhInfo})$ 

```

ask user validation of  $A_{out}$ ,  $B_{out}$ , amount

#### Command

CLA	INS	P1	P2	LC
02	7C	02	cnt	E3

#### Command data

Length	Value
01	options
01	1 if sub-address, 0 else
01	1 if change-address, 0 else
20	Real destination public view key $A_{out}$
20	Real destination public spend key $B_{out}$
20	encrypted amount key blinding $\mathcal{AK}_{\text{amount}}$
20	ephemeral hmac
20	$C_v$ of amount,mask
40	one serialized ecdhInfo : { bytes[32] mask ( $\widetilde{\text{mask}}$ ) bytes[32] amount ( $\widetilde{\text{amount}}$ ) }

#### *specific options*

-----xx	Mask scheme version
-----10	Blind V2
-----00	Blind V1

Note: Whatever the mask scheme is, amount is always transmited as 32 bytes.

#### 8.2.6.3 Finalize MLSAG-prehash

##### Description

Finally the application receives the last part of data:

if cnt == 1  
Initialize  $\mathcal{H}_{\text{commitment}}$

if last command:

```

    finalize  $\mathcal{H}_{\text{commitment}}$ ’,
    check  $\mathcal{H}_{\text{commitment}} == \mathcal{H}_{\text{commitment}}$ ’,
    update  $\mathcal{H}$ :
     $s = \text{finalize } \mathcal{H}$ 
    compute  $\mathcal{H} = \text{HashToScalar}(\text{message} \mid s \mid \text{proof})$ 

else
    update  $\mathcal{H}_{\text{commitment}}$ :  $\text{H}_{\text{update}}(C_v)$ 
    update  $\mathcal{H}$ :  $\text{H}_{\text{update}}(C_v)$ 

```

Keep  $\mathcal{H}$

### Command

## 8.2.7 MLSAG

### 8.2.7.1 MLSAG prepare

#### Description

Generate the matrix ring parameters:

```

generate  $\alpha_{in}$  ,
compute  $\alpha_{in}.G$ 
if real key:
    check the order of  $H_i$ 
    compute  $\alpha_{in}.H_i$ 
    compute  $\widetilde{\alpha_{in}} = \text{AES}[spk](\alpha_{in})$ 
    if not option_clear_xin:
        compute  $x_{in} = \text{AES}^{-1}[spk](\widetilde{x_{in}})$ 
        compute  $H_{in} = x_{in}.H_i$ 

```

return  $\widetilde{\alpha_{in}}$  ,  $\alpha_{in}.G$  [ $\alpha_{in}.H_i$ ,  $H_{in}$ ]

#### Command

CLA	INS	P1	P2	LC
02	84	01	cnt	61

*specific options*
